

## Abstract

In 2104, the notion of  $f$ -simplicial complexes and  $f$ -graphs were first presented in [12]. By definition, a graph  $G$  is said to be an  $f$ -graph if and only if the facet complex of  $I(G)$  and the non face complex of  $I(G)$  have the same  $f$ -vectors. The focus of this thesis will be on independence complexes constructed from independent sets of  $f$ -graphs. In this thesis, we give the characterization of independent sets of  $f$ -graphs and we discuss the connectedness of independent complex of  $f$ -graph. Additionally, we demonstrate that the independent complex of  $f$ -graph  $G$  is  $f$ -simplicial complex if and only if  $G$  is a path graph on 4 vertices or cyclic graph on 5 vertices.
