

ABSTRACT

The world has changed into a global village because of the use of technology and has also become equally vulnerable. This vulnerability or endangerment has become ever more palpable with the emerging global environmental crises. This project explores the global trend of urbanization in the two major urban centres of Pakistan, Karachi and Lahore. These cities are becoming rapidly urbanized as a result of the development of urban infrastructure and population growth. This study voices concern about the environmental fallout of this urban development. The study explores the factors of the urban system and highlights the way they impact the environment and damage it. This knowledge can be utilized to save the natural environment from further damage.
